**Abstract**— The LiDAR technology is rapidly advancing and revolutionizing the transportation industry, particularly in the development of self-driving cars. LiDAR sensors are now smaller, lighter, and more robust, making them suitable for use in a variety of vehicles. These sensors are capable of creating high-resolution 3D maps of the environment in real-time, providing self-driving cars with accurate perception of the road and surrounding obstacles. Along with cameras and radar sensors, LiDAR plays a crucial role in creating a comprehensive picture of the driving environment, enabling self-driving cars to make informed decisions and navigate complex driving scenarios. Despite its numerous benefits, LiDAR-based self-driving cars still face challenges such as safety concerns and potential impact on the job market. However, as manufacturers continue to invest in this technology, we can expect to see an increase in the number of self-driving cars on the road, offering safer and more efficient transportation options for the future.

**Keywords**— Lidar, Sensor, Obstacles, Detection, Light, Ranging.

## I. INTRODUCTION

The development of self-driving automobiles has increased the significance of the LiDAR technology. Self-driving cars are able to precisely detect their surroundings and avoid hazards because to the ability of LiDAR sensors to produce high-resolution 3D maps of the environment in real-time. This technology, along with other sensors such as cameras and radar, plays a crucial role in creating a comprehensive view of the driving environment, enabling self-driving cars to make informed decisions and navigate complex driving scenarios.

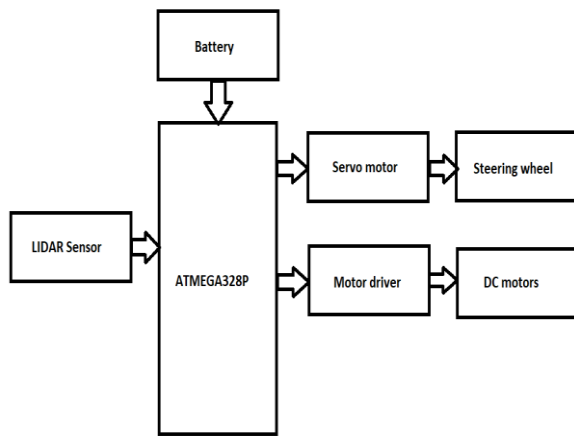

One of the key advantages of LiDAR-based self-driving cars is their flexibility. They can be programmed to operate in a variety of different driving conditions, making them suitable for a range of applications. For example, they can be programmed to drive defensively in heavy traffic, or to operate more aggressively on open roads. Additionally, LiDAR-based self-driving cars have the potential to reduce traffic congestion and improve safety, as they are not subject to human error and can communicate with other vehicles on the road.

## II. METHODOLOGY

The project's primary goal is to The LiDAR-based self-driving cars utilize LiDAR sensors to create high-resolution 3D maps of the surrounding environment in real-time. These maps enable the self-driving car to accurately perceive its surroundings and navigate complex driving scenarios by identifying and avoiding obstacles. LiDAR technology is combined with other sensors, such as cameras and radar, to create a comprehensive view of the driving environment, allowing self-driving cars to make informed decisions. The flexibility of LiDAR-based self-driving cars allows them to be programmed to operate in a variety of driving conditions and applications, from urban to rural areas.

Self-driving cars have a positive influence on the environment and promote safety while reducing traffic congestion. Researchers are attempting to increase the dependability and safety of this technology, but there are still issues to be resolved, including as safety concerns and potential effects on the transportation business.. Overall, LiDAR-based self-driving cars have the potential to revolutionize the transportation industry and provide safer, more efficient, and more environmentally friendly transportation options.

Another challenge is the cost and scalability of LiDAR technology. While LiDAR sensors have become more affordable in recent years, they are still relatively expensive, which could limit the widespread adoption of self-driving car technology. Efforts are underway to reduce the cost of LiDAR sensors and make them more scalable, which could help accelerate the development of self-driving cars.

### III. IMPLEMENTATION

Fig.1: Block Diagramhe process gets implemented LiDAR and microcontroller technology are both critical components of self-driving car systems. LiDAR sensors are used to collect data about the environment, while microcontrollers are used to process that data and control the self-driving car's movement and navigation.

#### 6.1 LiDAR Sensor

A laser beam is emitted by the LiDAR sensor and travels outside, reflecting off anything in its path. In order to determine the distance to the object, the sensor measures the time it takes for the laser to return to it. The LiDAR sensor can produce an accurate 3D map of the immediate surroundings in real-time by moving the laser beam around a 360-degree field of view.

As the self-driving car moves through the environment, it continuously collects new data from the LiDAR sensor and other sensors. This data is sent to the microcontroller, which updates the real-time map of the driving environment and adjusts the car's movement and navigation accordingly.

#### 6.2 Microcontroller (Atmega328P)

The data collected by the LiDAR sensor is sent to a microcontroller, which processes the data and makes decisions about how the self-driving car should navigate the environment. The microcontroller uses LiDAR sensor data and analyzes the data and identifies and classifies objects in the driving environment, such as other vehicles, pedestrians, and obstacles.

Based on this analysis, the microcontroller creates a real-time map of the driving environment and uses this information to plan the self-driving car's route and control its movement. The microcontroller also communicates with other systems within the self-driving car, such as the motor control system and braking system, to ensure that the car is moving safely and

#### 6.3 Servo motor

A servo motor is a type of motor that can be controlled with a high degree of precision, allowing it to accurately position the LiDAR sensor and adjust its direction as needed. In a self-driving car equipped with LiDAR and microcontroller technology, the servo motor is typically connected to the LiDAR sensor and controlled by the microcontroller. The microcontroller can send signals to the servo motor, telling it how to move and adjust the position of the LiDAR sensor in real-time.

By using servo motors to control the direction of the LiDAR sensor, self-driving cars can generate highly detailed 3D maps of the surrounding environment, even in complex and dynamic driving scenarios. The servo motor allows the LiDAR sensor to sweep across a 360-degree field of view, capturing data about the environment in all directions.

#### 6.4 Motor Driver

The motor driver is typically connected to the microcontroller and the motors themselves. The microcontroller can send signals to the motor driver, which then converts those signals into electrical currents that control the speed and direction of the motors.

By using motor drivers, self-driving cars can achieve more precise and efficient control over their motors, enabling smoother acceleration and deceleration, more accurate turning, and improved overall performance. This is particularly important in self-driving cars, where precise and reliable motor control is essential for safe and efficient navigation.

In addition, motor drivers can help to prolong the life of the car's motors by preventing them from overheating or burning out due to excessive use. By controlling the amount of electrical current supplied to the motors, motor drivers can ensure that the motors operate within safe and optimal parameters.

**Output:** Self-driving automobiles powered by LiDAR and microcontrollers provide a number of advantages over conventional human-driven vehicles, including increased safety, increased productivity, and less environmental impact.

The potential for self-driving cars to increase traffic safety is one of its main advantages. LiDAR sensors and microcontrollers enable self-driving cars to analyse and react to their environment more rapidly and precisely than human drivers, potentially reducing the amount of collisions brought on by driver mistake.

Self-driving cars can also improve efficiency by reducing congestion on roads and highways. By communicating with other self-driving cars and taking the most efficient routes, self-driving cars can reduce travel time and fuel consumption, resulting in cost savings for businesses and individuals alike.

In addition, self-driving cars have the potential to reduce environmental impact by improving fuel efficiency and reducing emissions. By taking the most efficient routes and avoiding stop-and-go traffic, self-driving cars can reduce fuel consumption and greenhouse gas emissions, helping to mitigate the impact of transportation on the

environment.

Additionally, self-driving cars provide greater mobility for people who are unable to drive because of a disability or other circumstances.. By providing a safe and reliable means of transportation, self-driving cars can improve access to jobs, education, and other opportunities.

## VI. ADVANTAGES VS DISADVANTAGES

### A. Advantages

Better Detection of Obstacles, Pedestrians, and Other Vehicles: LiDAR technology improves the safety of self-driving cars by delivering accurate real-time 3D mapping of the surroundings. These can greatly lower mishaps brought on by human mistake.

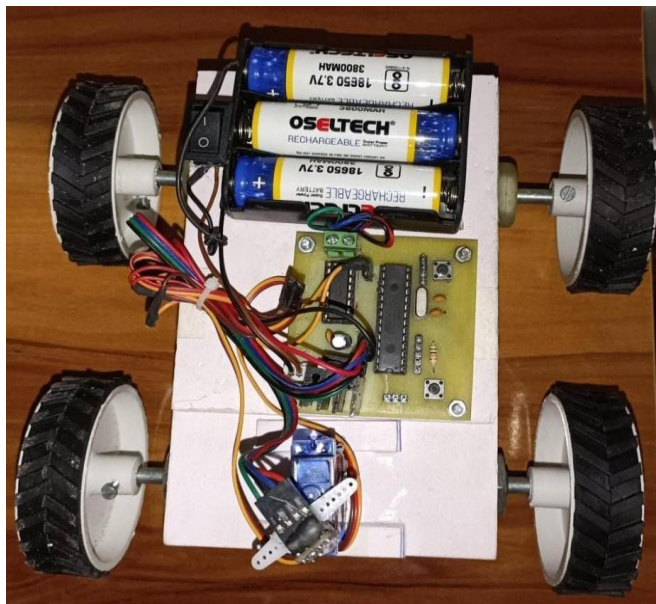

Fig. 2: Final Product

- **Enhanced Perception:** LiDAR's capacity to produce 360-degree, high-resolution maps gives self-driving cars a thorough understanding of their surroundings, even in poor light and inclement weather. The operating capabilities of autonomous cars are increased as a result.
- **LiDAR technology is essential for obtaining higher levels of autonomy** (such as Levels 4 and 5), when human intervention is either minimal or unneeded, in self-driving automobiles.

### B. Disadvantages

- **The expensive expense of LiDAR technology** is one of its main disadvantages. Since high-quality LiDAR sensors can be pricey, people may find self-driving cars to be less accessible.
- **Limited Range:** Compared to radar, LiDAR sensors have a shorter range, which may limit its capacity to detect objects at a great distance. In situations where prompt detection is essential, such as while driving on the highway, this limitation can be troublesome.

Overall, LiDAR and microcontroller-based self-driving cars offer many advantages, and these innovations have the potential to completely change the transportation sector in the years to come. There are still a lot of obstacles to be solved, including legal and moral dilemmas as well as technical difficulties with sensor accuracy and dependability. However, self-driving cars have a lot of potential advantages, and in the future, the transportation sector is expected to rely more and more on this technology.

## IV FUTURE SCOPE

1. **Integration with artificial intelligence (AI):** By integrating AI algorithms, the system can improve its ability to analyze and respond to complex driving situations.
2. **360-degree camera view:** A 360-degree camera system can provide a more comprehensive view of the vehicle's surroundings, improving the accuracy of obstacle detection and collision avoidance.
3. **Augmented reality displays:** Augmented reality displays can overlay information such as speed limits and turn-by-turn directions onto the driver's view of the road, improving situational awareness.
4. **Vehicle-to-vehicle (V2V) communication:** V2V communication can enable vehicles to share information with each other, allowing for better coordination and decision-making in high-traffic situations.

## ACKNOWLEDGMENT

Our warmest gratitude goes out to everyone who helped with the design and effective execution of the microcontroller-based auto driving assistance system.

First and foremost, we would like to acknowledge the support and guidance provided by our guide **Prof. Dr. Anil Shirsat**, whose insights have been instrumental in the success of this project.

We extend our appreciation to our Project-coordinators **Prof. Dr. Mrs. Manasi Kanitkar** and **Prof. Mr. Ramgopal Sahu** for giving us guidelines throughout and helping us at crucial stage.

We would also, like to take this opportunity and thank all the respected teachers and the Head of Department **Prof. Dr. Mrs. Rupali Kamathe** for showing us the right path at right time.

We would also like to thank our principal **Prof. Dr. Mrs. K. R. Joshi** for providing an opportunity for innovation and research and also granting a platform to showcase our hardwork and dedication.

At last, we would like to thank the industry expert **Mr. Ashish Wani** who gave us many valuable suggestions on how to enhance our project.
